

9-1-1 evolution

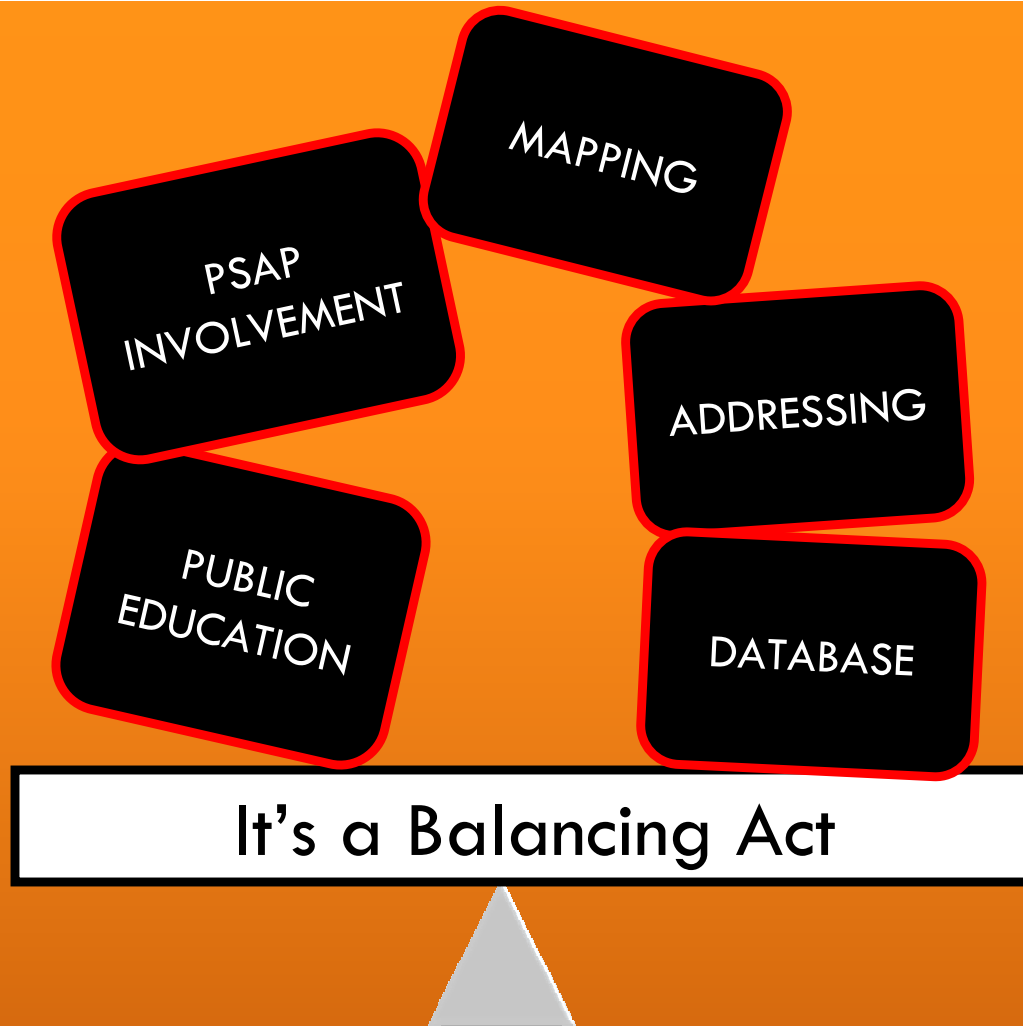

GIS and NG9-1-1 in Texas

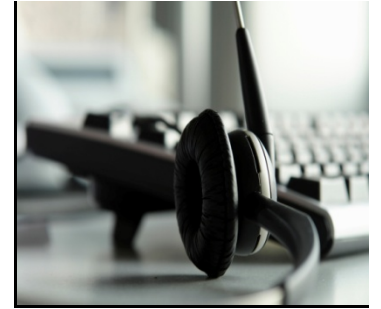

What we 9-1-1 Folks do...

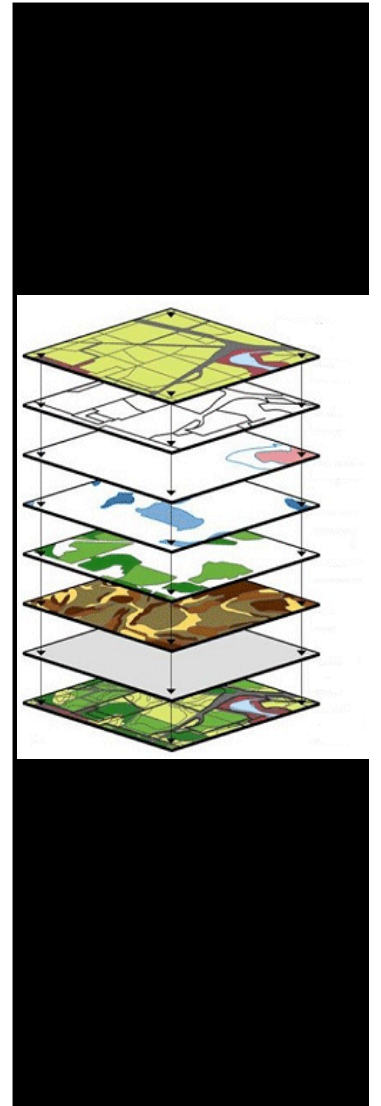

9-1-1's Funding
and Governing
Body in Texas

MAPPING

- Cross verify that addressing and database teams have correct information
- Input address points, street names and ranges, city limit boundaries, Emergency Service Number (ESN), and telco boundaries
- Update Public Safety Answering Point (PSAP) maps
- Update EMS and Fire Boudaries
- Provide mapping solutions for outside agencies. i.e. FBI, US Marshalls, District Attorneys Office

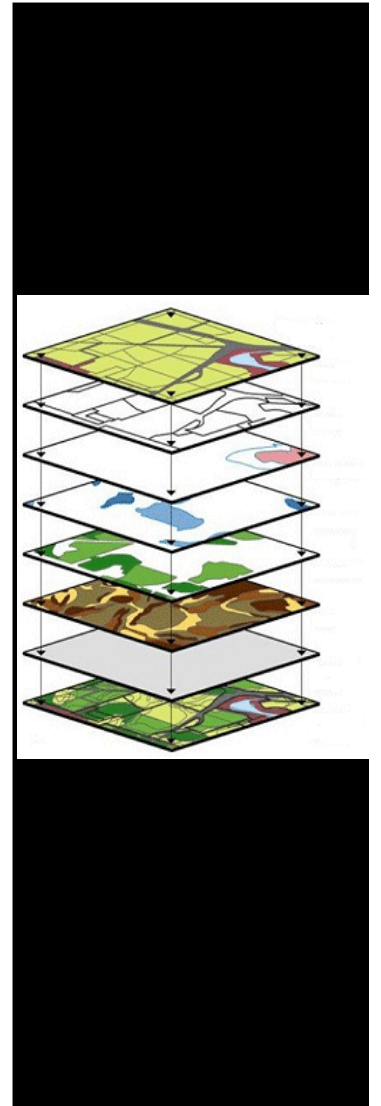

MAPPING

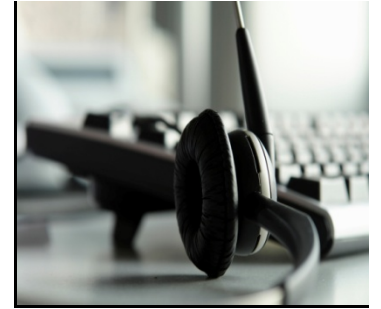

But the most important part of our mapping department is the driving force of it and that is:

GIS

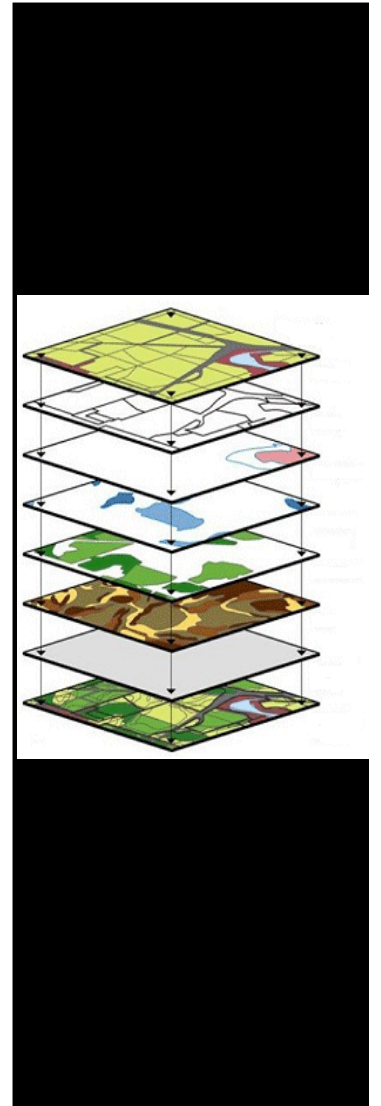

GIS

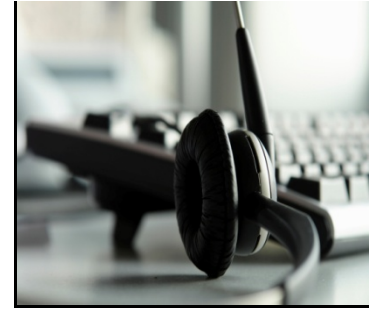

For the most part, 9-1-1 relies on GIS technology to locate individuals on an emergency call whether it be from:

- A house phone (wire line)
- A computer phone (VOIP)
- Or a cell phone

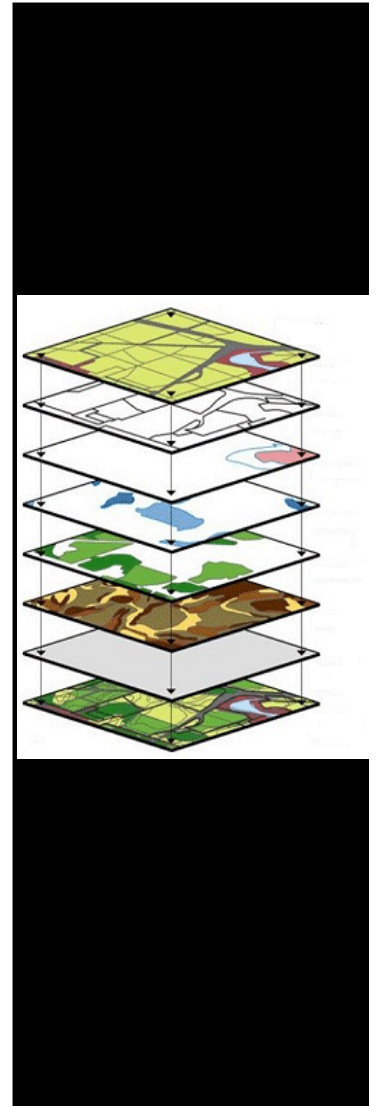

GIS

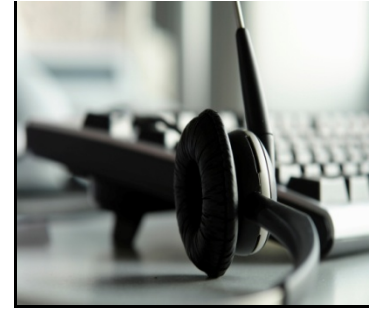

However, we are currently having to deal with an end of life, 40 year old system.

In which the big brother Database, is having to learn how to play with the younger brother and let him run the show in the near future NG9-1-1.

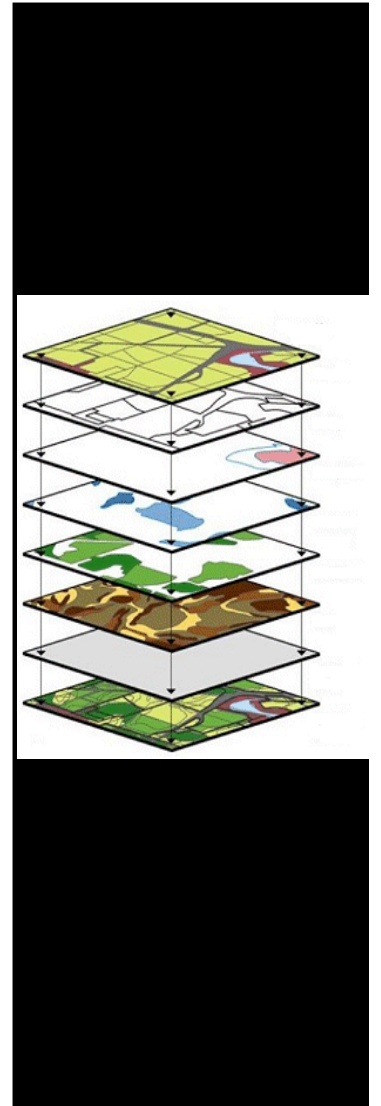

NG9-1-1

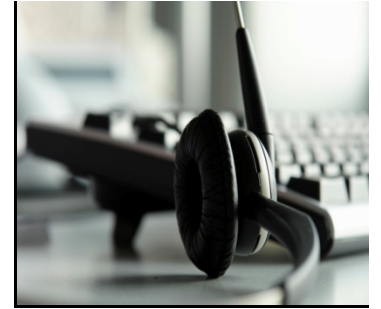

What is NG9-1-1?

Its a technological transition to a new 9-1-1 infrastructure, referred to as Next Generation 9-1-1 or NG9-1-1 as define by our state agency.

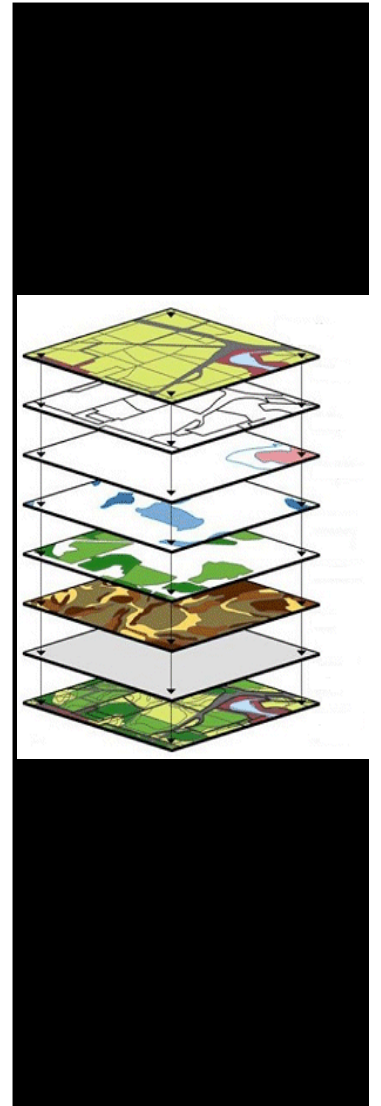

NG9-1-1

What it means to the public?

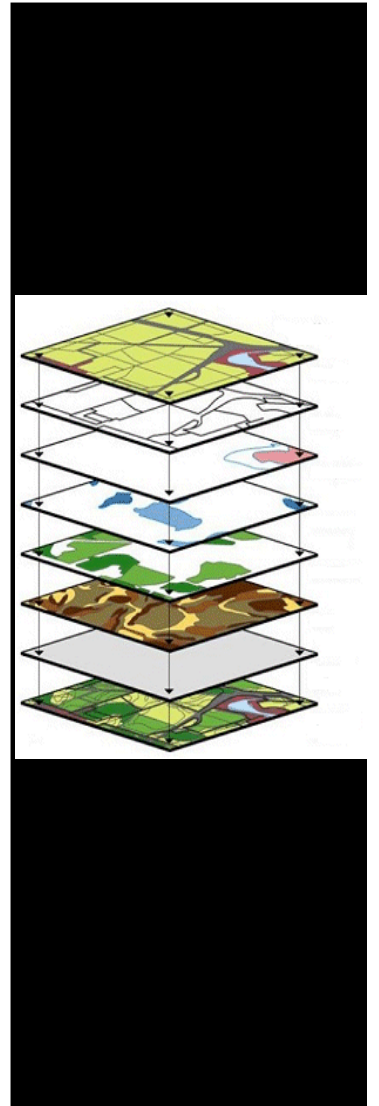

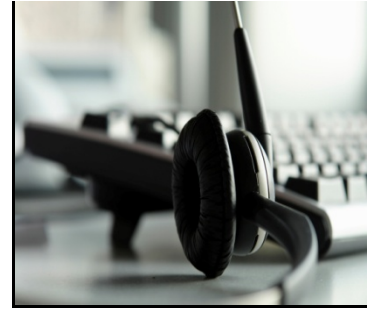

- It will meet the public's expectation of accessing 9-1-1 using a choice of communication technology.
- It will provide the emergency response community with quicker and more robust information.
- Create greater coordination capabilities.

GIS AND NG9-1-1

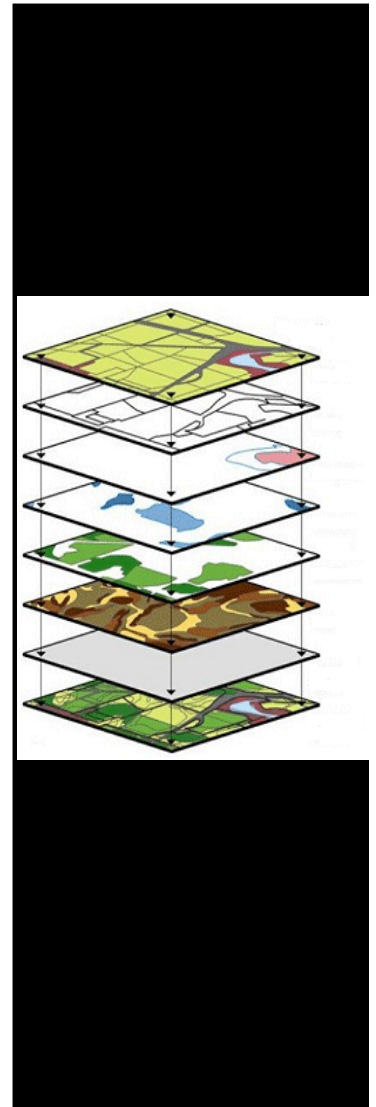

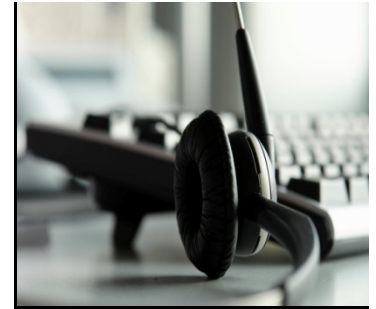

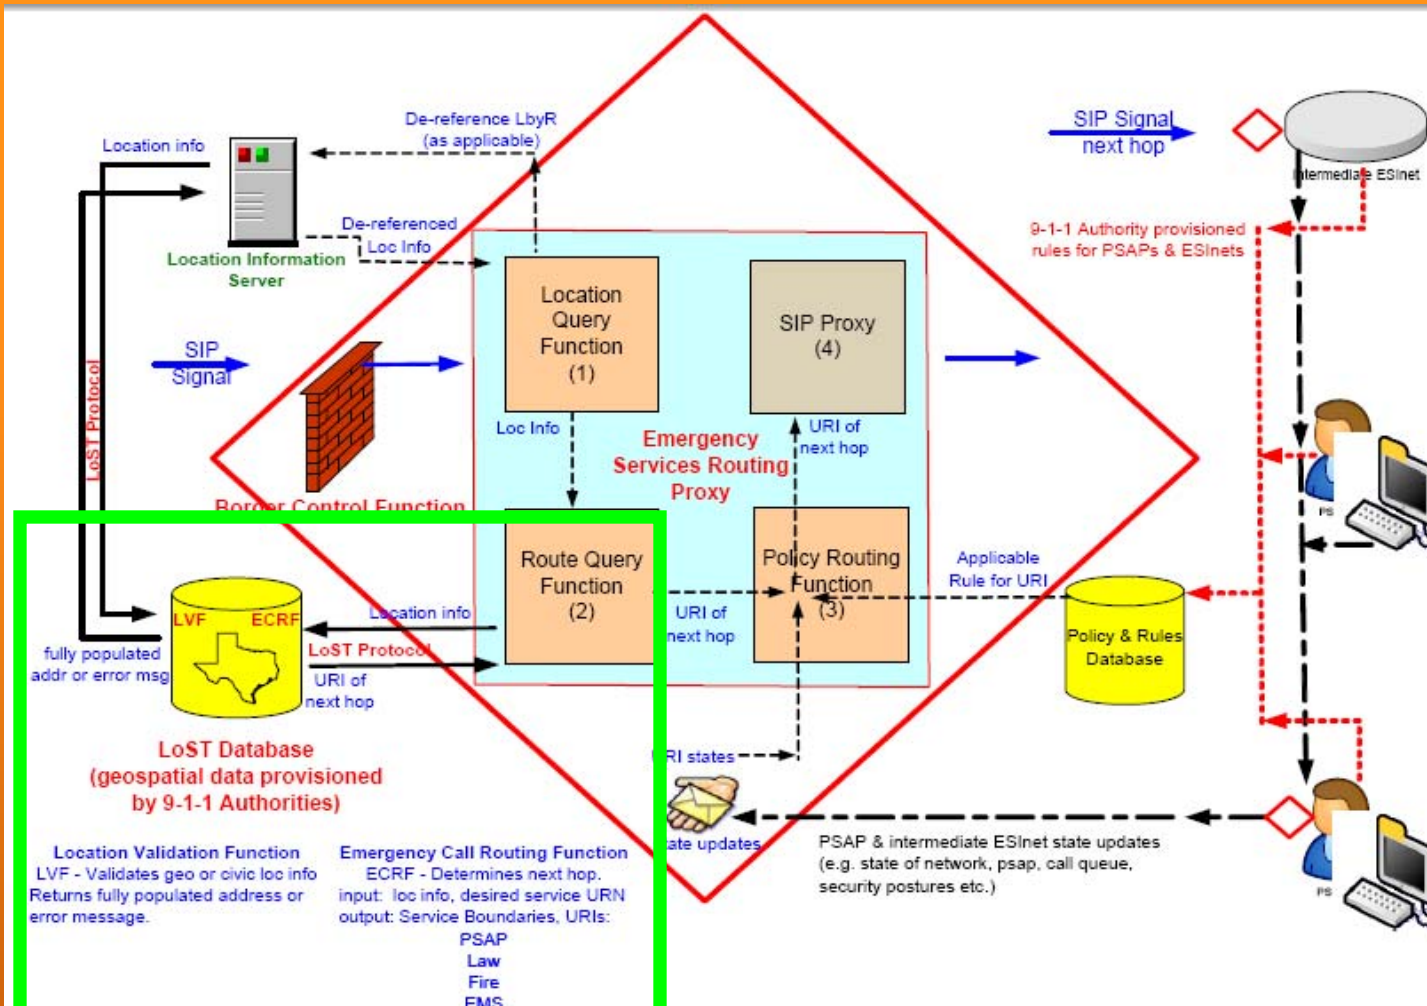

The integration of GIS into NG9-1-1 will be the heart and soul of this 9-1-1 evolution. This integration will allowed:

- Different Public Safety Agencies to work under the same network
- Most important centralize GIS data, hopefully geodatabase format, for emergency response at different strategic points.

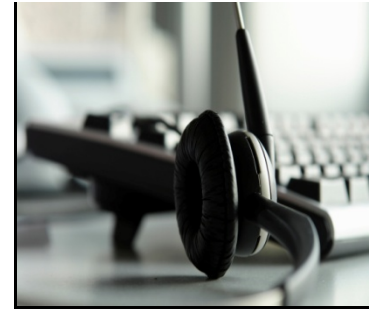

GIS AND NG9-1-1

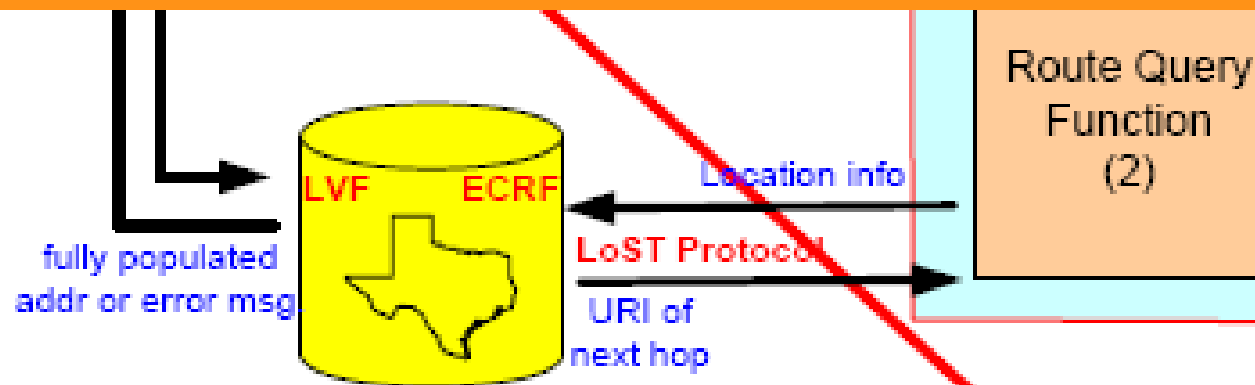

The essential core functions for NG9-1-1.

GIS AND NG9-1-1

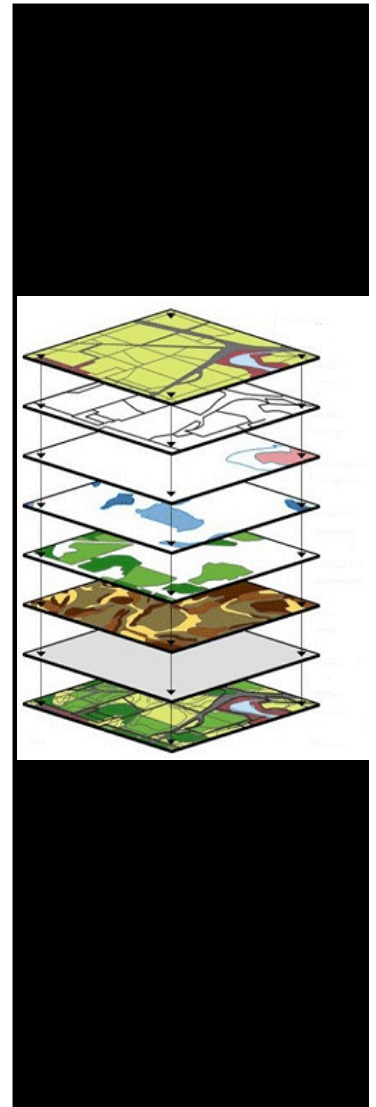

The LoST Database Server.

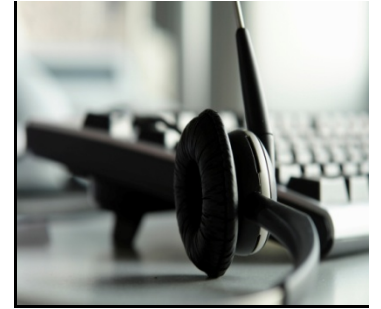

LoST Database
(geospatial data provisioned
by 9-1-1 Authorities)

Location Validation Function
LVF - Validates geo or civic loc info
Returns fully populated address or
error message.

Emergency Call Routing Function
ECRF - Determines next hop.
input: loc info, desired service URN
output: Service Boundaries, URIs:
PSAP
Law
Fire
EMS

GIS AND NG9-1-1

In GIS terms:

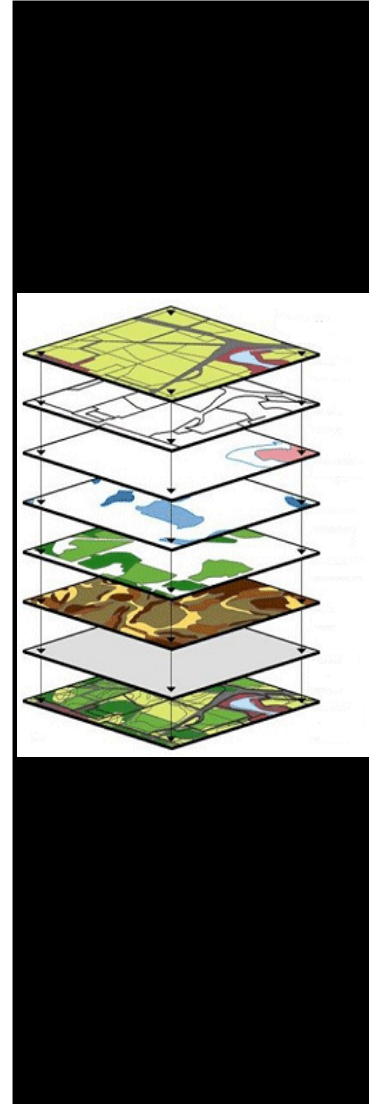

POLICE DEPARTMENT

123 Hurricane Dr,
McAllen, TX

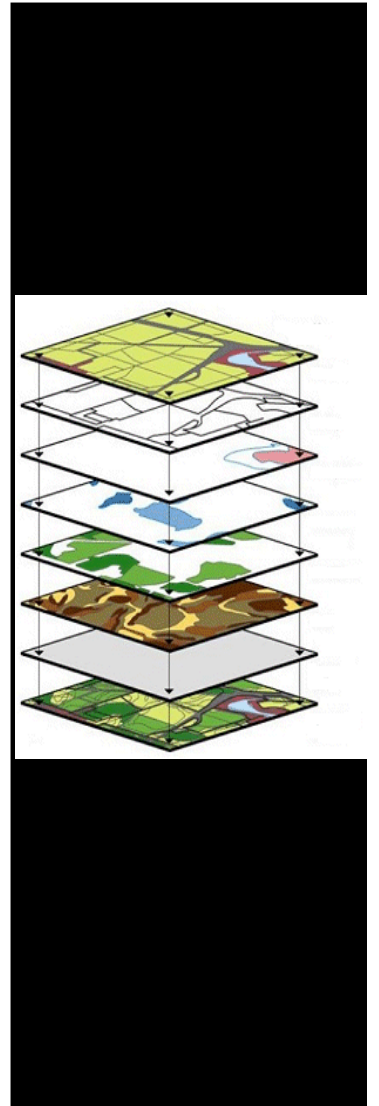

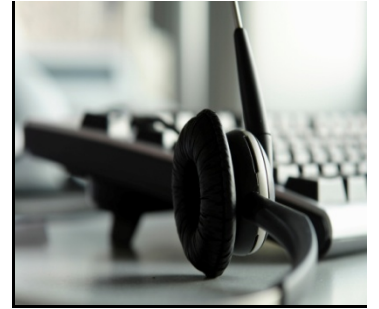

-97.123456, 26.987654

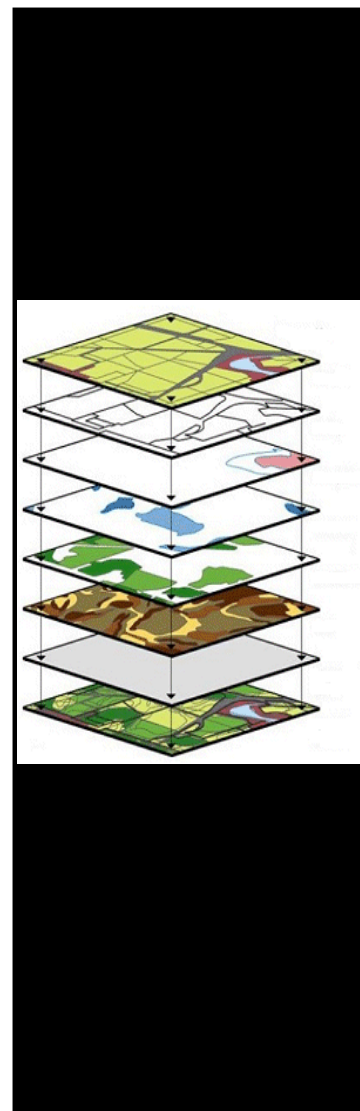

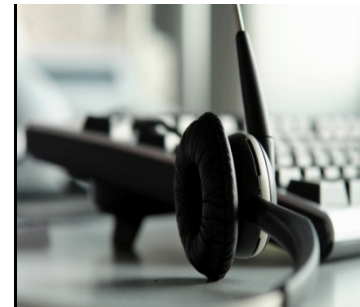

GIS AND NG9-1-1

In conclusion, the vision of the Texas NG9-1-1 System is aligned with:

- The National Emergency Number Association's (NENA) Functional and Interface Standards for Next Generation 9-1-1 Version 1.0 (i3) NENA 08-002
- The U.S. Department of Transportation (USDOT) NG9-1-1 System Initiative's Concept of Operation.
