

UTILIZING GIS, SERVICE LEARNING, AND LANDSCAPE ARCHITECTURE TO ASSIST OKLAHOMA COMMUNITIES

15th Annual OKSCAUG Conference

September 25, 2012

Moore Norman Technology Center, South Penn Campus

Room 109/ 110, 11:25 am – 11:55 am

Oklahoma City, OK

Leehu Loon, RLA, MLA, ASLA

Associate Professor and Graduate Liaison

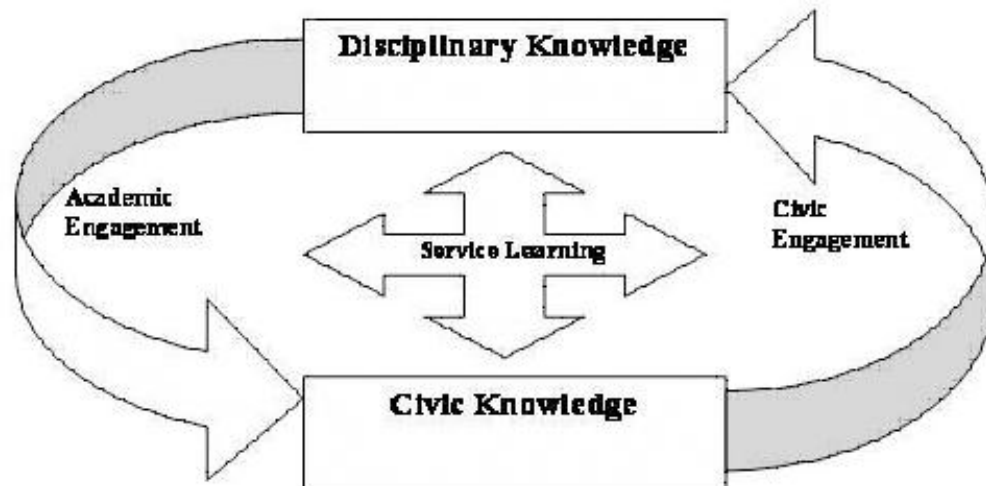

The University of Oklahoma

College of Architecture

Division of Landscape Architecture

What is Service Learning?

- “A credit bearing education experience in which students **participate** in an organized service activity that meets identified **community needs** in such a way as to gain further **understanding** of course content, a broader **appreciation** for the discipline, and an enhanced sense of **civic responsibility**.”
(Bringle and Hatcher, 1996)

Service Learning Model. (Source: University of Oklahoma Program for Instructional Innovation)

Importance of Service Learning in Landscape Architecture

- Well rounded educational opportunity
 - Project scope evolves throughout project.
- Multi-disciplinary education
 - Pivotal for design education to mimic real world application
 - Faculty can conduct applied research
- Positive impacts for Oklahoma communities
 - Connecting University to the taxpayers

Why does Service Learning work so well in Landscape Architecture?

- Intuitive nature of the design process
- Necessary dialogue between students and community is fundamental to learning
- Community feedback and participation
- Design process enriched by the understanding gained through the larger audience
- Connecting students to a community

Why GIS and Service Learning?

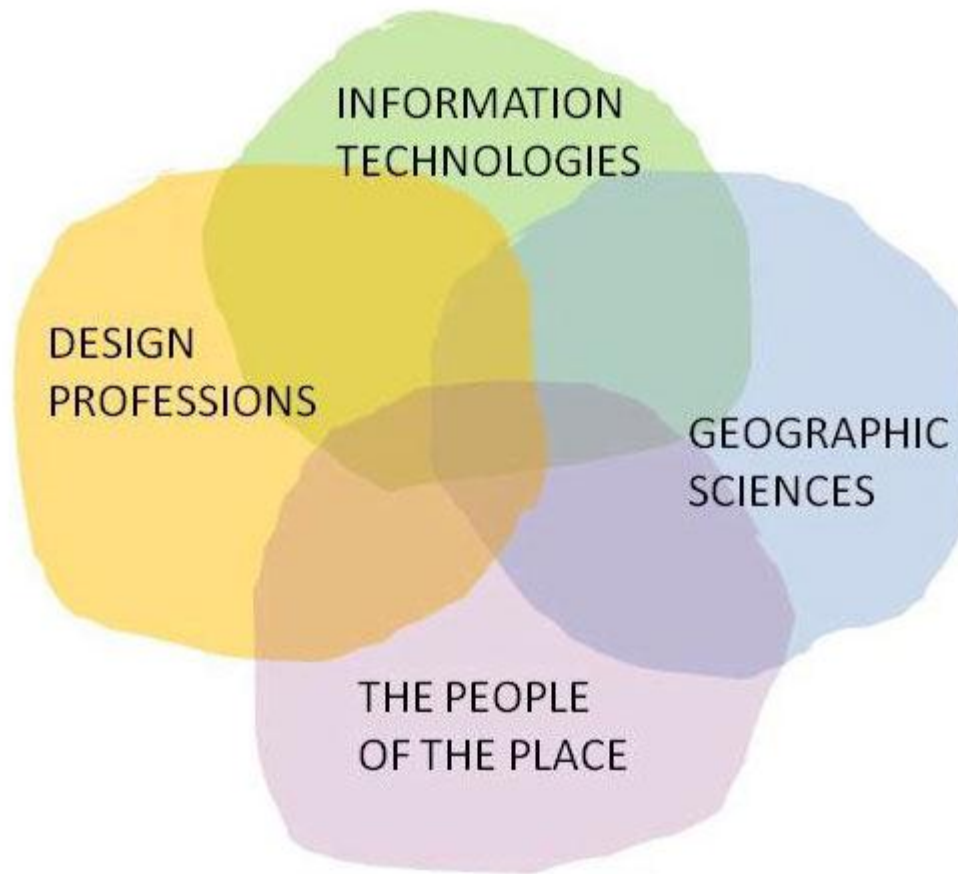

- Why try to incorporate GIS into the Landscape Architecture curriculum?
- And why incorporate it through a Service Learning project?

What is Geodesign?

- “Geodesign is the thought process comprising the creation of entities in geographic space.” –Bill Miller
- “Geodesign is designing with nature in mind.” –Jack Dangermond
- “Geodesign is changing geography by design.” –Carl Steinitz
- “Geodesign is both an old idea and a new idea.” –Jack Dangermond

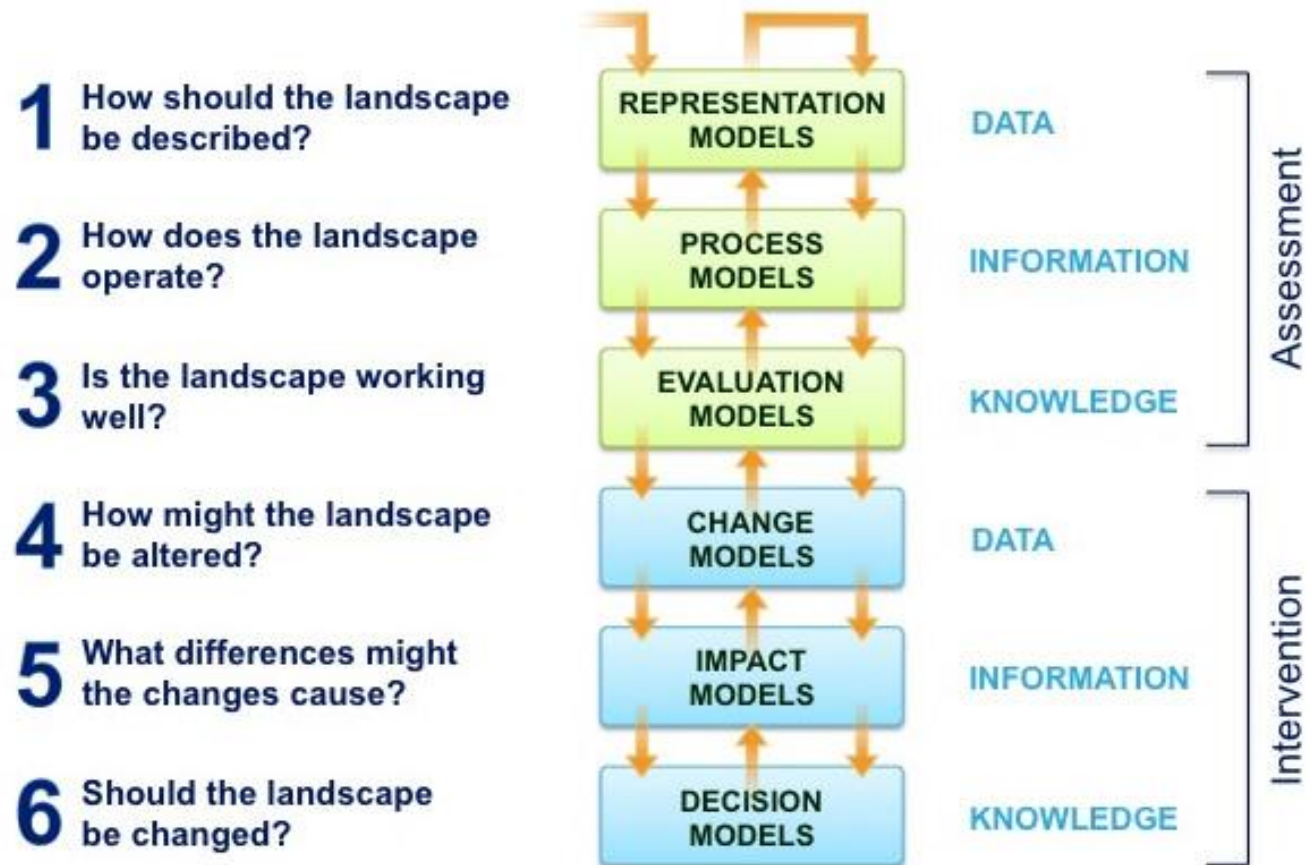

What is Geodesign?

- *A Framework for Geodesign: Changing Geography by Design.*
Written by Carl Steinitz, Esri Press, 2012.

A Geodesign Framework

The geodesign framework – by Carl Steinitz

LA at the University of Oklahoma

- Graduate Program
- First Professional Degree
- Design Studios are the foundation of the curriculum
 - Studio I: Fundamentals of Design
 - Studio II: Urban Design and GIS
 - Studio III: Park Design
 - Studio IV: Competition Studio (multi-disciplinary)
 - Studio V: Comprehensive Planning Studio (multi-disciplinary with RCPL)

GIS Methodology (Workflow)

- GIS Workflow from *Making Spatial Decision: Using GIS, A Workbook*
 - by Kathryn Keranen and Robert Kolvoord
- GIS Workflow
 1. Define the **problem** or scenario
 2. Identify the **deliverables** (mostly maps) needed to support the decision
 3. Identify, collect, organize, and examine the **data** needed to address the problem
 4. Document your **work**
 - Create a process summary
 - Document your map
 - Set the environments
 5. Prepare your **data**
 6. Create a **basemap** or locational map
 7. Perform the **geospatial analysis**
 8. Produce the **deliverables**, draw **conclusion**, and present the **results**

LA Design Process

- Pre-Project Design Phase Work
- Phase I: Data Collection and Analysis
- Phase II: Conceptual Design and/or Program Development and Planning Studies
- Phase III: Preliminary Master Plan
- Phase IV: Master Plan
- Phase V: Schematic Design
- Phase VI: Design Development
- Phase VII: Contract Documents
- Phase VIII: Bidding and Contract Award
- Phase IX: Construction Administration
- Phase X: Post Construction Observation and Evaluation

GIS Workflow and the LA Design Process

GIS Workflow

1. Define problem
2. Identify deliverables
3. Data
4. Document work
5. Prepare data
6. Create basemap
7. Perform geospatial analysis
8. Deliverables, conclusions, and results

LA Design Process

- I. Data Collection/ Analysis
- II. Conceptual Design
- III. Preliminary Master Plan
- IV. Master Plan
- V. Schematic Design
- VI. Design Development
- VII. Contract Documents
- VIII. Bidding/ Contract Award
- IX. Construction Administration
- X. Post Construction Observation/ Evaluation

Course Goals and Objectives

- Course Goals
 - Understand key areas of information, GIS, and design
- Course Objectives
 - Analyzing, synthesizing, and applying information pertinent to projects
 - What is meaning in built environment?
 - What is a sense of community?
 - Real world project
- Relevant issues: sustainability, urban form, pedestrian circulation, infill development, housing, density, mixed-use, public spaces, mixed-mode circulation; public participation, implementation and funding strategies, feasibility, and place.

Course Projects – Graphic Resume

- Visualizing data as a graphic resume
- Graphic communication is essential in landscape architecture
- Describe your skills in 20 seconds

GIS Workflow (4 of 8)

- 1: Define problem
- 2: Identify deliverables
- 5: Prepare data
- 8: Deliverables, conclusions, results

LA Design Process (2 of 10)

- I: Data collection/ analysis
- II: Conceptual Design

UNIVERSITY OF OKLAHOMA TREE INVENTORY

TREE INVENTORY

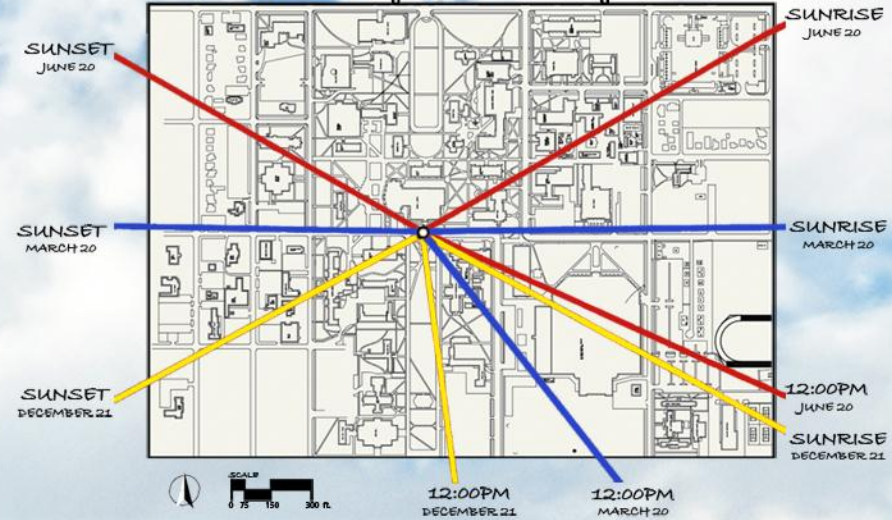

INVENTORY

Upon request of the University, our team will select and research the following information about existing trees on the site in order to help maintain and observe the health of the trees on campus:

- Location
- Size: Height and Circumference
- Species
- Overall health condition and amount of pruning needed
- Include conditions that may affect the tree- drainage problems, low sun, etc.

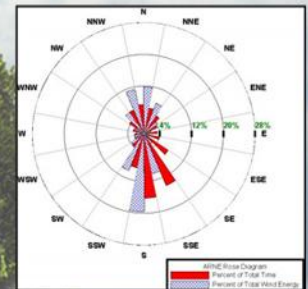

SUN ANGLE DIAGRAM

TREE INVENTORY MAP

The trees labeled on the map correspond with an attached spreadsheet containing detailed information about each tree.

PREVAILING WINDS

WIND ROSE

This diagram shows that the prevailing winds of this area come mainly from the south.

NORMAN CAMPUS TREE INVENTORY

the university of
OKLAHOMA

ALIX TYLER AND ARBY LIU - IA 5545525 COLLABORATION - PROF. L. LOON AND S. WILLIAMS

PROJECT OBJECTIVE: To locate, report, and analyze the location of ten trees around the University of Oklahoma's Main Campus and it's surrounding context.

METHODOLOGY: In order to accurately result in a tree analysis of the campus, a certain array of steps had to be implemented. These steps were done sequentially, and resulted in an extensive inventory and analysis of the 125 acre site of the Main Campus. We established our campus boundaries to be Boyd Street on the North, Lindsey on the South, Elm on the West, and Jenkins on the East.

Obtaining Base Map:

As a class, we were able to obtain a ten-year-old base map AutoCad File by getting in touch with the Architecture and Engineering Services. By using this AutoCAD file (.dwg) of the campus in 2000, we exported the .dwg file into Adobe Photoshop and then rendered the plan accordingly.

Inventory Collection:

Using the base map, our team surveyed the campus and by using a GPS receiver were able to collect the exact location of the ten trees. Inventory was then collected on certain items that we felt had either a physical or emotional relationship with the trees. This list consisted of:

- Circulation Patterns (Vehicular and Pedestrian)
- Vegetation (Trees, Lawns, Gardens)
- Destinations (Water Features, High-Use Buildings, Sculptures, Viewpoints)
- Wind Rose (Indicate both Time and Energy distribution of Wind)

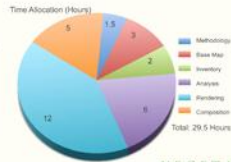

Graphic Analysis:

After inventory was collected, the data was then represented graphically over a simplified base map. The creation of these graphics allowed us to analyze the site through the obtained data and keen intuition. Analysis of our site was applied to each inventory rather quickly, thus spend more time creating an in-depth analysis and graphic composition.

PROJECT IMPLEMENTATION:

The methodology of the project did not take very long to establish, as through prior knowledge we were able to begin collecting data on the inventory rather quickly, thus spend more time creating an in-depth analysis and graphic composition.

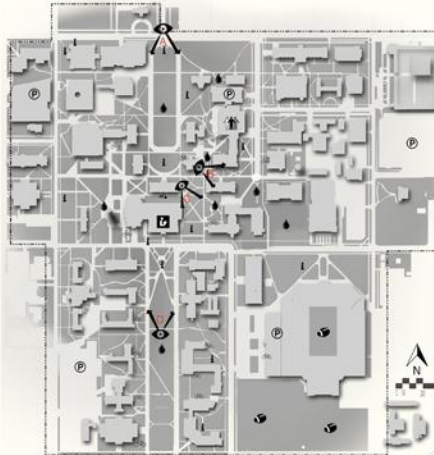

After the map was finished, a certain time was allotted for inventory gathering. We then spent the majority of the time working on the analysis of the site and producing the graphics that best represent our objective and methodology. These analyses are described more in depth in the correlated inventory graphic. The project was completed by two students, and took a total of 29.5 hours (shown right).

DESTINATIONS

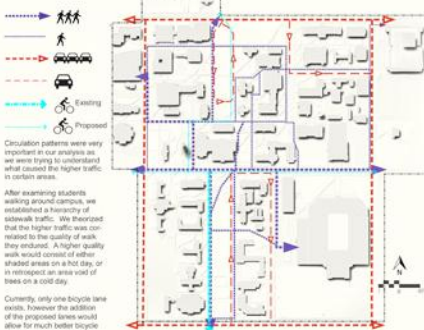

The viewpoints were chosen as specific destinations where the trees play a very large role on both the climate and aesthetic quality of the site.

EXISTING AERIAL VIEW

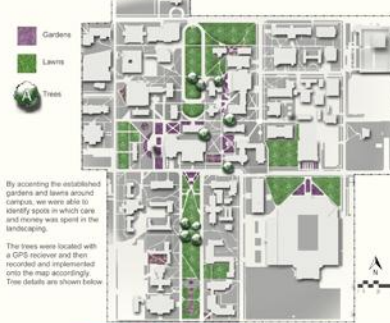

CIRCULATION

After examining students walking around campus, we established a hierarchy of sidewalk traffic. We theorized that the higher traffic was correlated to the quality of walk they endured. A higher quality walk would consist of well-shaded areas on a hot day, or in retrospect, an area void of trees on a cold day.

Currently, only one bicycle lane exists. However the addition of the proposed lanes would allow for much better bicycle circulation around campus.

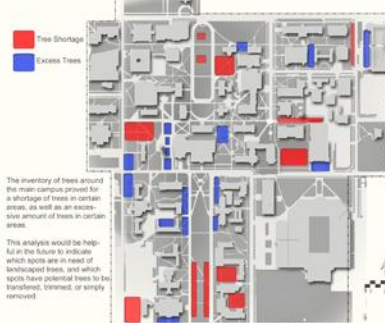

VEGETATION

By accounting the established gardens and lawns around campus, we were able to identify spots in which care and money was spent in the landscaping.

The trees were located with a GPS receiver and then recorded and implemented onto the map accordingly. Tree details are shown below.

FUTURE TREE MANAGEMENT

The inventory of trees around the main campus proved for a shortage of trees in certain areas, as well as an excessive amount of trees in certain areas.

This analysis would be helpful in the future to indicate which spots are in need of landscaped trees, and which spots have potential trees to be transplanted, removed, or simply removed.

WIND ANALYSIS

Central Oklahoma experiences some extremely windy days, and by utilizing trees as wind buffers, designers can create a much more comfortable place for the users.

Kessler Atmospheric and Ecological Field Station (KAEFS)

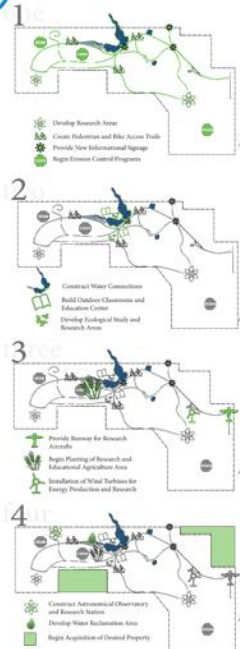

- 350 acres of mixed grass prairie
- Dr. Edwin Kessler donated a portion of his family farm to the University of Oklahoma for research and teaching
- Atmospheric and ecological research
- Research areas will be expanded in the future

Through a revitalization of the diverse ecosystems and the rejuvenation of the land, the Kessler Atmospheric and Ecological Field Station in conjunction with the University of Oklahoma, can provide an exciting and innovative learning sanctuary for students and researchers of all levels. Kessler offers a unique opportunity for researchers and visitors alike to gather information all the way from the atmosphere to below ground levels; a 360 degree look on the world in which we live.

- OPPORTUNITIES:**
- Unique ecologies that can be restored to their natural characteristics by removing invasive plant species and poor management practices.
 - Potential environmental and atmospheric learning tours and stations for REU programs and/or groups of students led by KAEPs guides.
 - Possible increased visibility of the KAEPs by promoting structured, programmed field events to the University of Oklahoma and Noble Foundation.
 - Scenic views overlooking native Oklahoma prairie and uninterrupted nighttime skylines for astrolological studies.
 - Rich Native American history that can be used as an educational tool for history from pre-Oklahoma times.

- CONSTRAINTS:**
- Unnoticeable arrival and uninviting tone at entrance of site.
 - Shortage of vehicular circulation throughout the site.
 - Lack of proximity in location to heavily populated areas or fairly frequently visited landmarks.

MISSION STATEMENT:

The mission of the Kessler Atmospheric and Ecological Field Station is to provide a venue for integrative and transdisciplinary investigations of atmospheric, ecological, and human interactions in the southern Great Plains rural landscape and to share the knowledge and information gained with the scientific community and the general public.

In pursuit of the mission:

1. KAEFS will promote crosscutting field-based research for a better understanding of atmospheric and ecological relationships within the context of land-use in the rural Oklahoma prairie environment.
2. Lead by example of environmental stewardship with low-impact development coexisting within the natural environment without compromising its integrity or long-term functionality.
3. KAEFS will create structured educational events & programs tailored to the learning of environmental and atmospheric sciences, and their effects on land use in the southern Great Plains.

CONCEPT STATEMENT

Student (10 years old) Narrative: We are on our way to the Kessler Atmospheric & Ecological Field Station for a field trip. I grew up in the city so I'm not very familiar with nature. The road we are on is very hilly and I see some farms along the road. We are coming upon a large corten steel structure that is the entrance to the site. As we drive down the road we come upon a really cool modern building, where we park. Inside this building is interesting interactive maps and activities for us kids that describe the native land we are on now as well as the different plants, wildlife, and climate for this site. Now it is time to go out and walk through the prairie, the grass is above my waist, I feel like an animal in it's native habitat. It is really windy today but I found a large boulder off the trail near a wooded area to sit protected from the wind and sun. It is cool to play in the dirt and discover animal tracks, and insects and worms. Me and some friends crossed a cool bridge where there was a small creek and learned the names of some trees. Our teacher told us that it is now time to go back in the bus and go to another part of the site.

We are now getting out at the Farmstead Museum; close to the farmhouse is a cool old dairy barn. At the dairy barn we get the chance to milk a cow, and learn about how much grass cows eat and how much milk they produce, the people on the farm used to have cows just like this. Inside the house we can read and see pictures of when Native Americans first lived here and when Dr. Kessler and the projects he was doing on this farm. They told us we could go behind the house and pick some apples, and this orchard is amazing as we walk down the allee of pear and apple trees. Once we are out of the orchard we come upon a large garden full of vegetables. Our teacher tells us that we have 5 minutes to pick some apples and then it is time to leave.

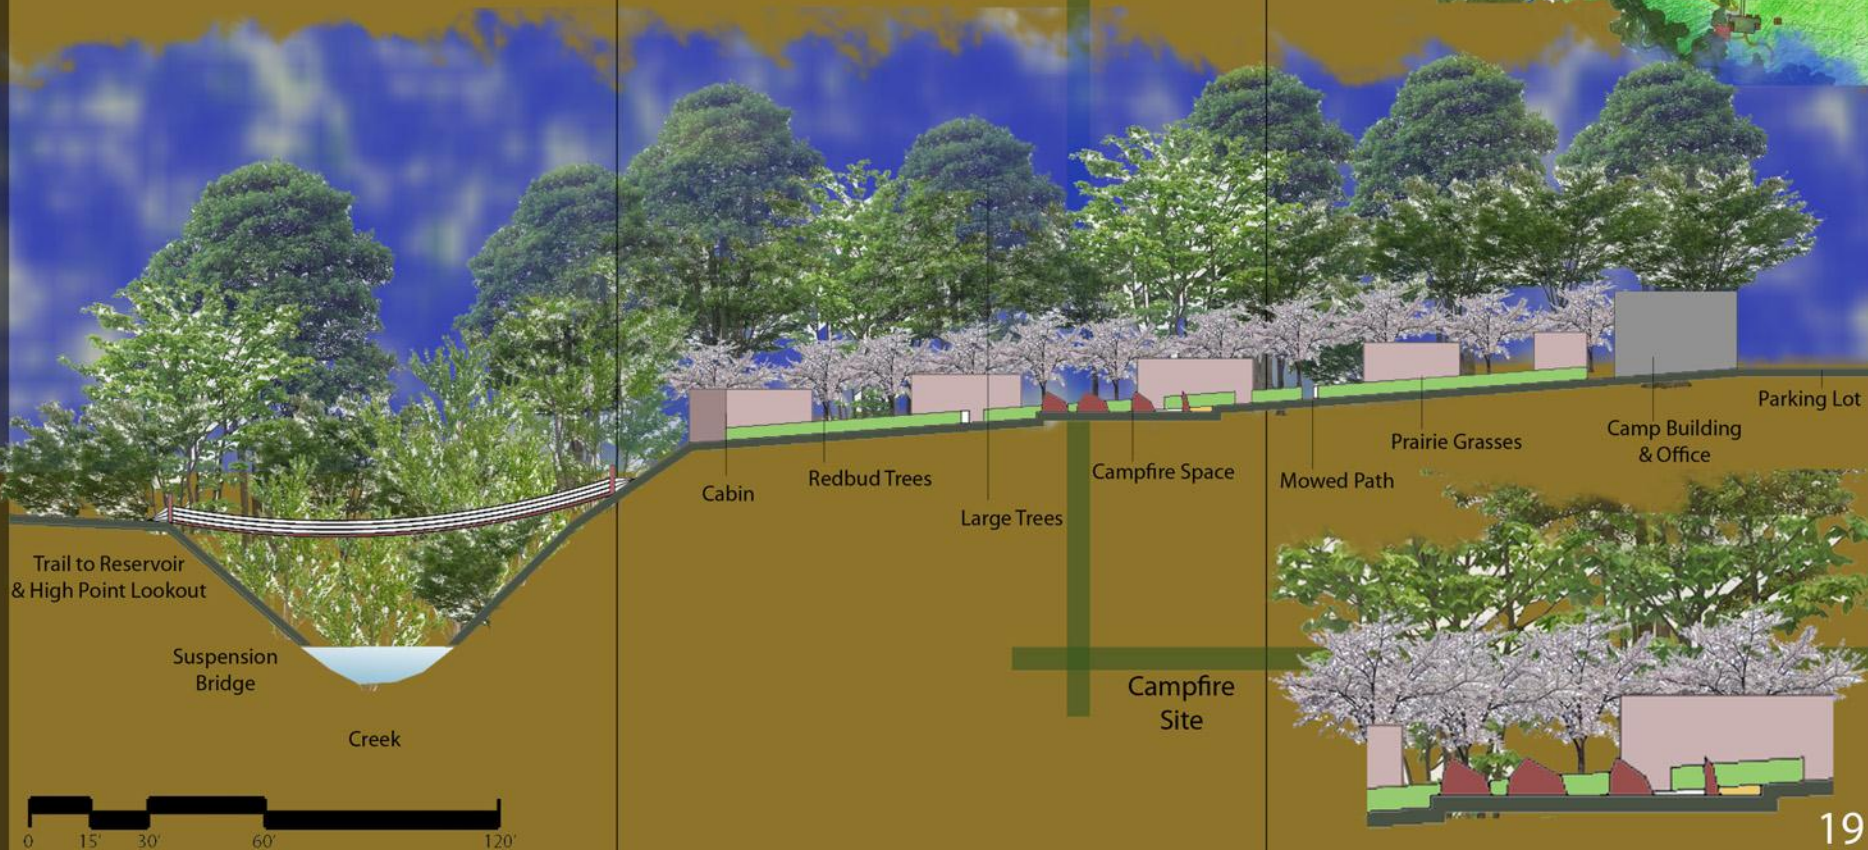

It has been a great day out here at this ecological research station. I learned so much about different species that live in Oklahoma's ecological habitat, I really enjoyed hands on experiences and being able to get outside and enjoy the land.

KESSLER ATMOSPHERIC AND ECOLOGICAL

PART 1: BACKGROUND

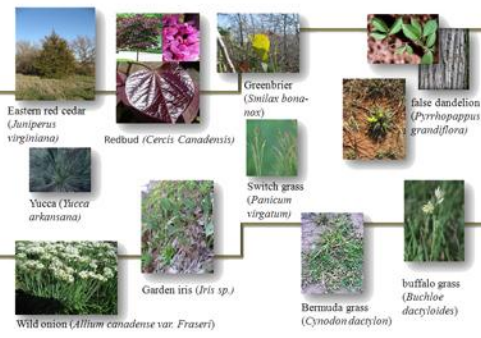

Kessler Educational, Ecological and Atmospheric Field is accessible by car and bike with an entrance from western avenue (North), from State Highway 39, I-35 Interstate Highway McClain County, Oklahoma. The distance between Kessler Educational Field Station to The University of Oklahoma Norman's campus is about 28 miles. It will take approximately 40 minutes by car and 90 minutes by bike.

An area about 360 Acre includes many wild species and insects, provides ecological value to research in many fields such as: Genetic, zoology.

TEMPERATURE
Average Annual: 61 degrees
Average Maximum: 73 degrees
Average Minimum: 49 degrees
Highest: 114 degrees (Purcell, August 11, 1936)
Lowest: -13 degrees (Purcell, December 23, 1989)
Days of 90 Degrees or Higher: 81
Days of 20 Degrees or Lower: 21

PRECIPITATION
Average Annual: 36.63 inches
Days With Precipitation: 74
Wettest Year: 57.69 inches in 1957
Driest Year: 19.19 inches in 1954
Greatest Daily Rainfall: 13.58 inches (Purcell, May 11, 1950)

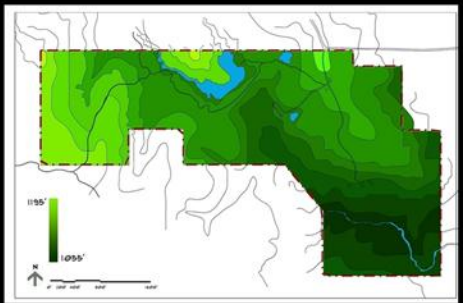

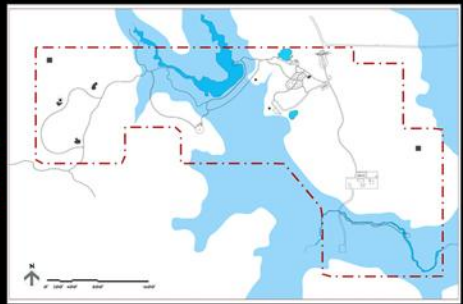

WINTER WEATHER
Average Annual Snowfall: 6.7 inches
Days with snow on ground: 5
Greatest Seasonal Snowfall: 24.5 inches (1987-1988)
Greatest Daily Snowfall: 14.0 inches (Purcell, March 6, 1989)
Last Freeze in Spring: April 4
First Freeze in Autumn: November 2
Growing Season: 212 Days

Program Explanation

The prairie has great mystery, variety, and beauty incomparable to any other landscape. However, these aspects are not clearly visible to most us. The prairie has a down-to-earth beauty that you really have to get down and carefully observe to discover. That is where the concept of education and conservation comes from. We are not trying to change the education that involves the university-- that is clearly running well on the site. What we are trying to do is educate people of the wonders of the prairie and, by doing that, we can help develop an understanding of why we should preserve the prairie. To do this, we must make the different areas of the site displaying simple wonder and aesthetics accessible. This begins with placing signs at intersections and the entry so visitors can easily navigate to the site. Once on the site, visitors can walk trails to places of rest where they can stop and interact with the landscape, learn interesting things, and take a closer look to discover the prairie.

HISTORY TRAIL

HISTORY TRAIL

Visitors can travel under the shelter of trees on the original historic road of the homestead and veer off along winding path following the creek. Information signs will explain the history and landscape. Visitors will experience close encounters with vegetation of the riparian areas and can reflect in a natural stone seating area.

CHILDREN'S LEARNING
CENTER

CHILDREN'S LEARNING CENTER

Ecological Tag Field and Wildlife Print Pad creates interactive learning for children while still teaching adults lessons by observing kids at play.

ACCESSIBLE TRAILS

ACCESSIBLE TRAILS

ADA trails allow all visitors the opportunity to explore large portions of the site. Made of compacted decomposed granite with a sealant topcoat, these trails can withstand light to moderate vehicular traffic as well.

LOOK-OUTS

LOOK-OUTS

Open structures provide shade for rest and reflection, as well as information about the land formation, vegetation, and other ecological facts. From these outlooks, visitors can view protruding clay rocks and the vegetation transition from lower slopes to riparian areas.

NATURAL ASPECTS

NATURAL ASPECTS

Nature is a major program of this design. The site's major advantage is the ability to visit the different vegetative systems and geographic forms within walking distance. The design will take full potential of the natural element of the site.

INFORMATION STATIONS

INFORMATION STATIONS

Plaques allow for self-guided tours while highlighting the impressive landscape, vegetation, and wildlife along the trails and inform visitors about conservation efforts.

KAEFS – Trail Planning

- Categorize circulation network
- Investigate standards
- Develop specifications
- Understand construction

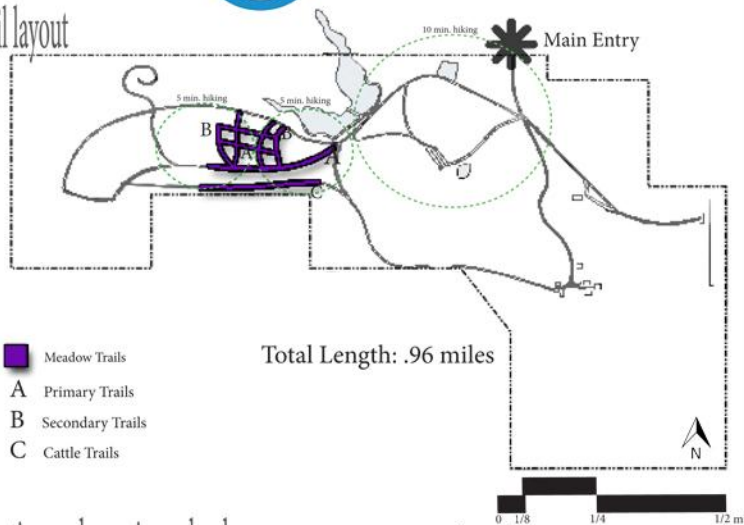

GIS Workflow (3 of 8)

- 4: Document work
- 7: Perform geospatial analysis
- 8: Deliverables, conclusions, results

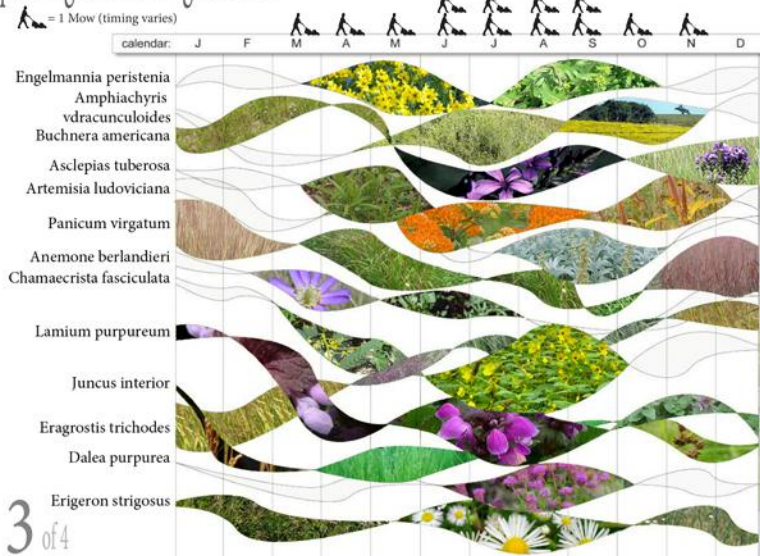

LA Design Process (3 of 10)

- VI: Design development
- IX: Construction administration
- X: Post construction observation/evaluation

trail layout

planting and mowing calendar

examples

Primary Meadow Paths

- 10-12' Wide, Found in High Traffic Areas of Meadow
- Crucial that mowing frequency is high during Spring and Summer Seasons, as well as the final mowing prior to Winter
- Trails are aesthetically rich and diverse, and provide a natural but maintained native meadow feel

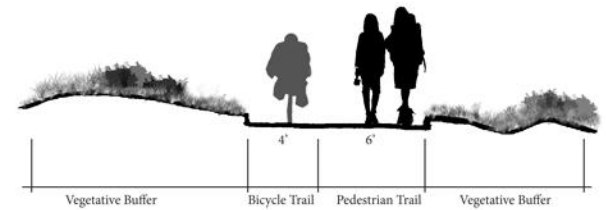

Secondary Meadow Trails

- 4-8' Wide, Found in Medium Traffic Areas of Meadow
- Mowing is less important than Primary Meadows, but still must be maintained in orderly manner (~50% less frequent than primary trails mowing)
- More natural, overgrown feel than Primary Trails

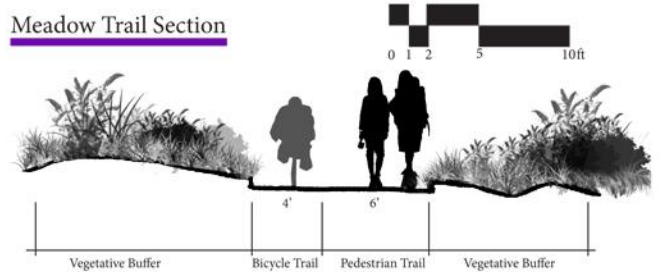

Meadow Cattle Trails

- Less traveled areas along outskirts of meadows or secondary system
- Use Weeder over Compacted Subsoil for maintenance, primary material is existing soil

PROJECT OVERVIEW

From my master plan proposal at KAEFS I have selected 3 types of surfaces to further develop; vehicular, grass, & a stabilized native trail that is ADA accessible. All will be made of natural materials so they will be congruent with the surrounding site. These different types of trails meet up at the main collection points on site, the Homestead Museum and the Ecological Welcome Pavilion. While planning the route of these trails, I kept in mind topography, views that can be seen while on the trails, and distance to certain points on site.

The gravel road that I will be using for vehicles will be similar to the gravel road it branches off of, creating a unity within its context. The grass trail will be part of the existing grassland prairie, only mowed to a height of 4 inches, for easier accessibility. By keeping this path like the current grassland users will feel one with the site and be able to not only experience nature off the site but actually on it as well. The ADA stabilized native trail will be able to accommodate wheelchairs due to the bonding agent on the surface of the path making the site useful for all visitors.

University of Illinois-Urbana
American Trails.org
Enviroseal.com

Because the gravel and grass trails are natural, there is no need to go into detail on the construction of these trails; however, I will take time to explain a little more on the ADA paths. I will be using a product named Enviroseal M10+50, an all-natural water emulsified co-polymer acrylic resin used as a binder in water erosion control; it helps create smooth hard surfaces while still being natural and permeable. A 2-5 ton roller and tractor with tiller are machinery that will be needed for the application. 5-6 gallons of M-10+50/ cubic yard is initially mixed into the soil, this should account for 60% of the mix, and the remaining 40 % is withheld for topical applications. Next, compact the surface with the roller then allow this to set for 30-60 minutes. After this time, apply the first coat of water & M-10+50 mixture to seal the surface – the mix ratio should be 16 fluid ounces of M-10+50 with equal amounts of water. We will then apply a second coat within 15 minutes of the top coat. The finished surface should be available within a few hours after completion.

Seeing as this is an ecological site, monitoring the construction process will be important. Thankfully, due to the material of the trails, heavy construction will not be necessary on our site. The presence of the trail types and locations will not disrupt current habitats and will hopefully be a thread in the fabric on site. Permeability natural materials will be possible on all trail surfaces. When dealing with maintenance, mowing the grassland trails and bringing in new gravel for the road when needed will be a priority on site. Overall, the proposed trails on site will be a great compliment on site and will also be able to accommodate ADA personnel.

I will be developing trails within this shaded area.

TRAIL LOCATION AND MATERIAL DROP-OFF AREAS

SLOPE ANALYSIS

(x)% - Slopes in red require handrails per 2010 ADA Standards for Accessible Design

TRAIL PERSPECTIVE

MATERIAL DROP-OFF AREAS AND MATERIAL

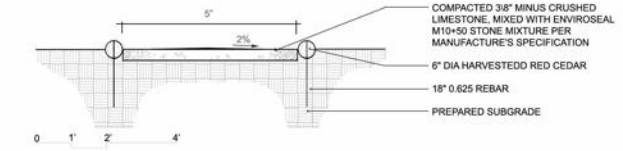

There are very few restrictive landforms or vegetation along the route of designated trail. However, the conservation efforts of the project will limit the material drop areas to minimize the destruction of established vegetation. Drop zones are established in areas where a road is currently established or construction will occur. This will limit large heavy machinery destroying the landscape established. A skid-steer loader, compact track loader, compact tractor, or similar sized or smaller machinery may be used to transport material from drop-off areas to designated trail. This will reduce the amount of construction damage experienced on the site.

The materials used to surface the trail will be compacted 3/8" minus limestone, mixed with Enviroseal m10+50 stone mixture per manufacturer's specification. This material will not create opening that allow the passage of a 1/2 inch diameter sphere according to the 2010 ADA Standards for Accessible Design. 6" diameter Eastern Red Cedar harvested from site will line the outer line of the trail to ensure stabilization of surface material. The Eastern Red Cedar will be secured 18" into subgrade to prevent shifting.

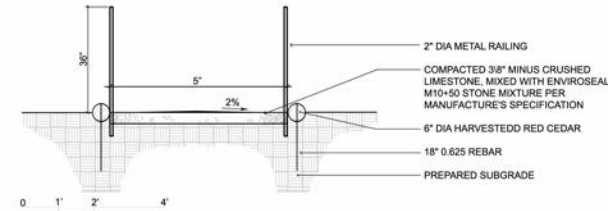

ADA ACCESSIBLE TRAIL

The Children-Peconet Trail will meet ADA Standards. The Department of Justice 2010 ADA Standards for Accessible Design in accordance of Americans with Disabilities Act of 1990 will be followed to allow access to all users of any ability. The width of the trail will be 5' minimum to allow for adequate passage of users. The slopes of the trail that range from 0% to 4.9% meet the standards for a ADA walkway and will require minimum construction of grading and surfacing. Construction of this portion of the trail is explained by (1) 0% - 4.9% ADA Trail Detail. The portion of the trails that consist of slopes of 5.0% to 8.33% will require handrails to meet compliance standards. Construction of the portion of the trail is explained by (2) 5% - 8.33% ADA Trail Detail and (3) ADA Trail Railing Detail. Slopes greater than 8.33% are illegal slopes for ADA accessible routes. If route of trail exceeds the 8.33% slope, this portion will be regraded or rerouted to meet ADA standards.
